Hess J.F., Casselman J.T., FitzGerald P.G.;
"Nucleotide sequence of the bovine vimentin-encoding cDNA.";
Gene 140:257-259(1994).
-I- FUNCTION: Vimentins are class-III intermediate filaments found i various non-epithelial cells, especially mesenchymal cells.
-I- SUBUNIT: HOMOPOLYMER.
-I- SUBUNIT: HOMOPOLYMER.
-I- PTM: ONE OF THE MOST PROMINENT PHOSPHOPROTEINS IN VARIOUS CELLS MESENCHYMAL ORIGIN. PHOSPHORYLATION IS ENHANCED DURING CELL DIVISION, AT WHICH TIME VIMENTIN FILAMENTS ARE SIGNIFICANTLY

**Characterization of the chicken vimentin gene: single copy gene producing multiple mRNAs.*;

Proc. Natl Acad. Sci. U.S.A. 80:911-915(1983).

1- FUNCTION: Vimentins are class-III intermediate filaments found in various non-epithelial cells, especially mesenchymal cells.

1- SUBUNIT: HOMOPOLYMER.

1- PIM: ONE OF THE MOST PROMINENT PHOSPHOPROTEINS IN VARIOUS CELLS OF MESENCHYMAL ORIGIN. PHOSPHORYLATION IS ENHANCED DURING CELL DIVISION, AT WHICH TIME VIMENTIN FILAMENTS ARE SIGNIFICANTLY TENERGY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VIME_CHICK STANDARD;

CATALYZES GUANINE NUCLEOTIDE EXCHANGE FACTOR THAT POTENTIALLY LINKS PATHWAYS THAT SIGNAL THROUGH RACI, KHOA AND CDC42. CATALYZES GUANINE NUCLEOTIDE EXCHANGE ON RHOA AND CDC42 AND INTERRACTS SPECIFICALLY WITH THE GTP-BOUND FORM OF RACI, SUGGESTING THAT IT FUNCTIONS AS AN EFFECTOR OF RACI. MAY ALSO PARTICIPATE IN AXONAL TRANSPORT IN THE BRAIN. BECOMES ACTIVATED AND HIGHLY TUMORIGENIC BY TRUNCATION OF THE N-TERMINUS (BY SIMILARITY).

1- TISSUE SPECIFICITY: EXPRESSED AT LOW LEVELS IN SEVERAL HEMOPOIETIC CELL LINES AND IN THYMUS AND SPLEEN, AND AT HIGHER LEVELS IN OTHER TISSUES, PARTICULARLY IN BRAIN.

1- SIMILARITY: CONTAINS 1 BH3 DOMAIN.

1- SIMILARITY: CONTAINS 1 DBL-HOMOLOGY (DH) DOMAIN.

1- SIMILARITY: CONTAINS 1 CRAL-TRIO DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a human DNA fragmentation factor subsof 40 kDa, designated DFF40. The specification also describes DFF45. DFF40 is capable of inducing apoptosis, and may contain a nuclear localisation fragment. DFF45 acts as a molecular chaperone to direct the folding of DFF40. Although all DNase activity is associated with DFF40, DFF activity only occurs once DFF40 is complexed with DFF45. The DFF polypeptides and polynucleotides are useful for inhibiting the growth of cancer cells, and for inducing apoptosis of cells.

DFF is a heterodimeric protein comprising 40KDa and 45KDa subunits. DFF45 acts as a molecular chaperone to facilitate the appropriate folding of DFF40 and acts as an inhibitor for DFF40. DFF40 and DFF45 are used in gene therapy. The modulators of human DFF40 activity are useful for inducing apoptosis and for treating hyperproliferative disorders such as restenosis, psoriasis, metastatic tumours, angiogenesis and benign and malignant neoplasias. They are also used for treating cancers of the brain (glioblastoma, astrocytoma, astrocytoma, astrocytoma, astrocytoma and ependymoma), lung, liver, spleen, kidney, lymph node, pancreas, small intestine, blood cells, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone marrow, blood, other tissue and multi-drug resistant cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying modulator of human DNA fragmentation factor 40, for treating cancer, involves contacting cell or cell-free composition comprising DFF40 with candidate substance and comparing apoptosis with control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Fig 1; 52pp; English.

Active CPAN proteins can be used for identifying compounds which inhibit apoptosis. Inhibitors of apoptosis can be used therapeutically, e.g. where cells are damaged and the apoptotic pathway is initiated such as by heart attack or stroke. The inactive CPAN proteins can be used for identifying compounds which activate apoptosis. Compounds which activate apoptosis can be used for apoptosis can be used to treat tumours. The association of CPAN with a caspasee-sensitive inhibitor suggests that when cells enter into apoptosis, the activation of caspases will trigger CPAN to become
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-JAN-1998;

                                                                                                                                                                                                                                                                                                                                          The present invention describes an inhibitor (ICAD) for caspase-activating DNase (CAD). Two ICAD's are specifically claimed: a long chain form (ICAD-s), and a short chain form (ICAD-s). ICAD and ICAD cDNa can be used in the prevention of cell death, and can be used as a research reagent for cell death. The present sequence represents mouse CAD which is used in the exemplification of the present invention.

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis and/or activity, insunomodulatory activity and may be useful in the diagnosis and/or the telement of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-FEB-2000; 2000US-0515126

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-MAR-2000; 2000US-191637P

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides an antibody which reacts with a cleavage product of vimentin but not with the intact protein. This can be used to detect apoptosis, which may then be used as an indicator of the progression of diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, Basedow's disease and acquired immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibody reacting with a cleavage product of vimentin but not with the intact vimentin, useful for detecting apoptosis and the quantity of cleavage product of vimentin or as a reagent for immunohistochemical
                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                     syndrome (AIDS).

                                                                                                                                                                                          The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB159202 to AB159912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression profile or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

                                                                                                                                                          Proteins AAW54349-W54364 are examples of proteins produced in the endometrium during the hyperplasia, adenocarcinoma or proliferative phase of the endometrium. The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of cell lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                            Sequence

9635
AAB29635 standard; Protein;
The invention relates to the human pollinosis-associated gene 795 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has homology with the human vimentin gene. The invention also relates also relates to the protein encoded by pollinosis gene 795; to expression constructs and host cells comprising pollinosis-associated gene 795 nucleic acids; pollinosis-associated gene 795 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 795 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 795 nucleic acids. The invention additionally encompasses methods of
                                                                                                                                                                                                                                                                                                                                                                                                                (GENO-)

Pollinosis-associated gene 795 is useful in the diagnallergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a protein encoded by human pollinosis-associated gene 795.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAU87694 standard; Protein; 466
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides an antibody which reacts with a cleavage product of vimentin but not with the intact protein. This can be used to detect apoptosis, which may then be used as an indicator of the progression of diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, Basedow's disease and acquired immunodeficiency

A composition comprising the polynucleotide, its encoded protein, or an antibody that binds to the protein may be used in the diagnosis, prevention and/or treatment of diseases, particularly pancreatic cancer. The sequences of the invention are also useful in pharmaceutical compositions, e.g. vaccines, for the diagnosis and treatment of pancreatic cancer. Such compositions may be useful for inhibiting the development of cancer in a patient, or as markers for the progression of cancer. The polynucleotide sequences may also be used as probes or primers for nucleic acid hybridisation assays.

AAU87689-AAU87694 represent human pancreatic tumour proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of cDNA sequences (ABK44061-ABK4209) encoding human pancreatic tumour proteins. The polynuclectide sequences encoding human pancreatic tumour proteins are useful for stimulating an immune response in a patient and treating pancreatic cancer in a patient. A host cell that expresses these polynuclectides is useful for determining the presence of cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2; Page 165-167; 167pp; English.

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activity inhibit activity and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and/or treatment of care levels and may be useful in the diagnosis and levels are useful in the diagnosis are useful in the diagnos

                                                                                                                                                               The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating
